

AI-Driven Employee support with watsonx

Business Problem

Galicia faced the challenge of providing efficient internal support to its employees through an assistant capable of answering frequently asked questions and managing the creation of support tickets in ServiceNow.

The existing solution had limitations in terms of integration, scalability, and the naturalness of the interaction. The objective was to replace the current assistant with a set of AI agents that could centralize information, improve the user experience, reduce time-to-production for new use cases, and provide a more natural conversational interface.

Scalability, 24/7 availability, accurate and well-grounded responses and direct integration with ServiceNow and Microsoft Teams.

How IBM Solved It

IBM designed and implemented an agent-based architecture using IBM watsonx Orchestrate. In this model, an orchestrator agent receives the employee's request and, based on the detected intent, routes the request to specialized collaborator agents. These agents handle either frequently asked questions or the creation of support tickets.

The solution included a secure integration with ServiceNow, ensuring compliance with the client's security restrictions when creating and managing support tickets.

To maximize accessibility and convenience for employees, the assistant was deployed within Microsoft Teams, allowing users to interact with the solution directly from their existing workplace collaboration tool.

The solution is hosted on IBM Cloud and also incorporates watsonx.governance, enabling monitoring, analytics, and governance capabilities for the deployed agents. During the implementation, the system demonstrated the ability to interpret employee requests in natural language, classify them automatically, and route them to the appropriate agent for resolution. The client validated the approach positively and confirmed that it aligned well with their expectations and operational needs.

Value and Impact of Outcomes for customers

- Improved employee experience, providing a natural, accessible, and always-available support channel
- Scalable and modular architecture, enabling the organization to easily add new agents and expand use cases over time.
- Centralized governance and monitoring, ensuring visibility and control over the behavior and performance of AI agents.

Value and Impact of Outcomes for IBM

- Strengthened client relationship, reinforcing IBM's position as a trusted partner
- watsonx showcase, demonstrating the practical capabilities of watsonx Orchestrate and watsonx.governance in a real enterprise scenario.
- Scalable AI service, delivering a secure, cloud-based solution on IBM Cloud tailored to the client's needs.
- Future growth opportunities for further AI-driven automation initiatives.
